

**IN THE CLAIMS:**

Please find below a listing of all pending claims. The statuses of the claims are set forth in parentheses. For those currently amended claims, underlined emphasis indicates insertions and ~~strike through~~ emphasis (and/or double brackets) indicates deletions.

1. (Currently Amended) A computer program product including computer executable instructions stored on a computer readable medium, wherein the instructions, when executed by the computer, cause the computer to perform:
  - creating structure information that indicates a relation between a program call structure and data input-output information of the computer program source code by analyzing a computer program source code;
  - creating process-outline information of the computer program source code from a part of the structure information;
  - creating computer program specifications of the computer program source code by using the process-outline information;
  - extracting a comment ~~from the computer program specifications~~ that is created on the basis of the computer program source code, the comment is added by a user to a predetermined position ~~in~~ after the computer program specifications are created; and
  - adding the comment extracted to a predetermined position in computer program specifications to be created.

2. (Original) The computer program product according to claim 1, wherein
  - the creating of the process-outline information includes extracting information of a subroutine of a specific nesting level and data input-output information of the subroutine, and
  - the creating of the computer program specifications includes using the information of the subroutine and the data input-output information of the

subroutine.

3. (Original) The computer program product according to claim 2, wherein the computer program specifications created include a call structure diagram in a tabular form that has a plurality of columns assigned to respective nesting levels of subroutines, wherein a name of each subroutine is shown in a column corresponding to a nesting level of the each subroutine.

4. (Original) The computer program product according to claim 1, wherein  
the creating of the structure information includes creating structure information that indicates a relation between a program call structure and a program call condition,

the creating of the process-outline information includes creating process-outline information that indicates a relation between a program call structure and a program call condition, and

the creating of the computer program specifications includes creating computer program specifications that indicate a relation between a program call structure and a program call condition.

5. (Canceled)

6. (Original) The computer program product according to claim 1, wherein the instructions further cause the computer to perform:

creating program-outline information of the computer program source code by summarizing statements included in the computer program source code;

creating a program-outline statement in a natural language from the program-outline information; and

creating a program-outline document of the computer program source code by using the program-outline sentence.

7. (Original) The computer program product according to claim 6, wherein the creating of the program-outline information includes

- determining a significance level of data included in the computer program source code;

- determining a significance level of a statement included in the computer program source code by using the significance level of data; and

- summarizing statements included in the computer program source code by using the significance level of the statement.

8. (Original) The computer program product according to claim 1, wherein the instructions further cause the computer to perform:

- extracting input-output information of a job step included in a batch job from a batch-job script described in a batch-job script language;

- acquiring input information and output information of the overall batch job based on the input-output information of the job step;

- specifying a job step at which the information acquired is input or output;

- extracting information of a computer program called at the job step specified;

and

- creating batch-job process-outline information of the batch job by using the input information specified, the output information specified, and the information of the computer program extracted.

9. (Original) The computer program product according to claim 1, wherein the instructions further cause the computer to perform:

- creating screen transition information by analyzing screen definitions which define information of a screen; and

- creating a screen transition diagram by using the screen transition information.

10. (Original) The computer program product according to claim 9, wherein  
the screen definitions include information of transition between the screen  
and a computer program expressed in the computer program source code, the  
screen transition information includes information of transition between the screen  
and the computer program, the instructions further cause the computer to perform:  
creating merge diagram information in which the transition and input-output  
of the computer program are merged, by merging the screen transition information  
with the structure information, wherein  
the creating of the screen transition diagram includes creating a diagram in  
which the transition and the input-output of the computer program are merged, by  
using the merge diagram information.

11. (Currently Amended) A computer readable medium on which is stored  
computer executable instructions for creating computer program specifications,  
comprising:

computer executable instructions for a first creator that creates structure  
information that indicates a relation between a program call structure and data  
input-output information of the computer program source code, by analyzing a  
computer program source code;

computer executable instructions for a second creator that creates process-  
outline information of the computer program source code from a part of the  
structure information;

computer executable instructions for a third creator that creates computer  
program specifications of the computer program source code by using the process-  
outline information, and outputs the computer program specifications; and

computer executable instructions for a comment entry contents inheritor that  
extracts a comment from the computer program specifications that is created on the  
basis of the computer program source code, the comment is added by a user to a  
predetermined position ~~in~~ after the computer program specifications are created;

and adds the comment extracted to a predetermined position in the computer program specifications to be created.

12. (Currently Amended) A method of creating computer program specifications, comprising:

- creating, by analyzing a computer program source code, structure information that indicates a relation between a program call structure and data input-output information of the computer program source code;

- creating process-outline information of the computer program source code from a part of the structure information;

- creating computer program specifications of the computer program source code by using the process-outline information;

- extracting a comment from the computer program specifications that is created on the basis of the computer program source code, the comment is added by a user to a predetermined position ~~in after~~ the computer program specifications are created; and

- adding the comment extracted to a predetermined position in computer program specifications to be created.
